

Connecting to the Office Weather MCP Server

A demo MCP server exposing office weather data — one setup guide per platform.

Server URL	https://office-weather.onrender.com/mcp
Tool	get_weather — weather at our office locations
Resource	offices://locations — list of office cities
Prompts	guardrails, cricket_expert, badminton_expert

Note: This URL only works while the server owner has it running. Free ngrok domains also change if the tunnel restarts — if a step in this guide stops working, ask for the latest URL.

- Claude Code
- Claude Desktop
- Quick troubleshooting

CONNECT_TO_OFFICE_WEATHER_MCP · 2026-08-19

STEP 1 · RECOMMENDED FIRST STEP

Check it in MCP Inspector

Before wiring the server into a real client, confirm it's reachable using the official MCP Inspector tool.

1. Run the Inspector

```
npx @modelcontextprotocol/inspector
```

2. Open the connection panel

It opens in your browser. In the connection panel, set:

- **Transport Type:** Streamable HTTP
- **URL:** paste the server URL (must end in `/mcp`) — <https://office-weather.onrender.com/mcp>

3. Connect

Click **Connect**.

4. Verify

Once connected, check the **Tools**, **Resources**, and **Prompts** tabs — you should see:

- **get_weather** under Tools
- **offices://locations** under Resources
- The three prompts (**guardrails**, **cricket_expert**, **badminton_expert**) under Prompts

If this works, the server is reachable and you can move on to a real client.

STEP 2

Add it in Cursor

1. Open the config file

Open (or create) `~/.cursor/mcp.json`.

2. Add a server entry

Add an entry under `mcpServers`:

```
{
  "mcpServers": {
    "office-weather-demo": {
      "url": "https://office-weather.onrender.com/mcp"
    }
  }
}
```

3. Reload Cursor

Reload Cursor (or use the **Reload** button in MCP settings).

4. Confirm the connection

Go to **Cursor Settings** → **MCP** and confirm **office-weather-demo** shows as connected, with **get_weather** listed under Tools.

Note: Cursor only supports the tools and resources primitives. The guardrails / cricket_expert / badminton_expert prompts won't appear here — that's expected. Use Inspector or Claude Code/Desktop to see those.

STEP 3

Add it in Claude Code

1. Register the server

Run this in a terminal (not inside a Claude Code session):

```
claude mcp add --transport http office-weather-demo \  
https://office-weather.onrender.com/mcp
```

2. Verify the connection

Then start (or return to) a Claude Code session and run:

```
/mcp
```

You should see **office-weather-demo** listed as connected.

3. Use it

From there you can:

- Ask "what's the weather at Office 1?" → triggers the `get_weather` tool
- Reference `@office-weather-demo` → pulls in the `offices://locations` resource
- Run `/mcp__office-weather-demo__cricket_expert` → loads that persona prompt

STEP 4

Add it in Claude Desktop

1. Open Connectors settings

Claude Desktop → **Settings** → **Connectors**.

2. Add a custom connector

Click **Add custom connector**.

3. Enter the connector details

Name	office-weather-demo
URL	https://office-weather.onrender.com/mcp

4. Save and confirm

Save, and confirm it shows as **Connected**.

5. Try it out

Start a new chat and try:

```
"What's the weather at our Delhi office?"
```

Use the + (attach) menu to browse resources/prompts from the connector.
