

Connecting to the Office Weather MCP Server

This is a demo MCP server exposing:

- **Tool:** `get_weather` — weather at our office locations
- **Resource:** `offices://locations` — list of office cities
- **Prompts:** `guardrails`, `cricket_expert`, `badminton_expert`

Server URL (given to you separately):

```
https://<your-ngrok-domain>.ngrok-free.app/mcp
```

⚠ This URL only works while the server owner has it running. Free ngrok domains also change if the tunnel restarts — if a step below stops working, ask for the latest URL.

1. Check it in MCP Inspector (recommended first step)

1. Run the Inspector:

```
npx @modelcontextprotocol/inspector
```

2. It opens in your browser. In the connection panel:

- **Transport Type:** `Streamable HTTP`
- **URL:** paste the server URL (must end in `/mcp`)

3. Click **Connect**.

4. Once connected, check the **Tools**, **Resources**, and **Prompts** tabs — you should see `get_weather`, `offices://locations`, and the three prompts listed.

If this works, the server is reachable and you can move on to a real client.

2. Add it in Cursor

1. Open (or create) `~/.cursor/mcp.json`.
2. Add an entry under `mcpServers`:

```
{
  "mcpServers": {
    "office-weather-demo": {
      "url": "https://<your-ngrok-domain>.ngrok-free.app/mcp"
    }
  }
}
```

3. Reload Cursor (or use the "Reload" button in MCP settings).
4. Go to **Cursor Settings** → **MCP** and confirm **office-weather-demo** shows as connected, with **get_weather** listed under Tools.

Note: Cursor only supports the **tools** and **resources** primitives. The **guardrails** / **cricket_expert** / **badminton_expert** **prompts** won't appear here — that's expected, use Inspector or Claude Code/Desktop to see those.

3. Add it in Claude Code

Run this in a terminal (not inside a Claude Code session):

```
claude mcp add --transport http office-weather-demo https://<your-ngrok-domain>.ngrok-free.app/mcp
```

Then start (or return to) a Claude Code session and verify:

```
/mcp
```

You should see **office-weather-demo** listed as connected. From there you can:

- Ask "what's the weather at Office 1?" → triggers the **get_weather** tool
- Reference **@office-weather-demo** → pulls in the **offices://locations** resource
- Run **/mcp__office-weather-demo__cricket_expert** → loads that persona prompt

4. Add it in Claude Desktop

1. Open Claude Desktop → **Settings** → **Connectors**.
2. Click **Add custom connector**.
3. Enter:
 - **Name:** **office-weather-demo**
 - **URL:** **https://<your-ngrok-domain>.ngrok-free.app/mcp**
4. Save, and confirm it shows as **Connected**.
5. Start a new chat and try:
 - "What's the weather at our Delhi office?"

- Use the + (attach) menu to browse resources/prompts from the connector.
-

Quick troubleshooting

- **Can't connect anywhere** → the server or ngrok tunnel may be down; check with the server owner.
- **Works in Inspector but not in a client** → double check the URL ends in `/mcp` and transport is set to Streamable HTTP (not SSE/stdio).
- **No prompts showing in Cursor** → expected, Cursor doesn't support MCP prompts.
- **"ngrok-free.app" domain looks different than before** → free-tier ngrok URLs change on restart; ask for the current one.
